Background of the Invention

This invention relates to compositions and methods useful for delaying or ameliorating human diseases associated with glucose intolerance.

Diabetes is a major disease affecting over 16 million individuals in the United States alone at an annual cost of over 92 billion dollars.

20 Type I diabetes or insulin-dependent diabetes (IDDD) is an autoimmune disease. In the IDDM patient, the immune system attacks and destroys the insulin-producing beta cells in the pancreas. The central role of insulin in human metabolism is to aid in the transport of glucose into muscle cells and fat cells. The body's inability to produce insulin results in hyperglycemia, ketoacidosis, thirst, and weight loss. In addition, diabetics often suffer from chronic atherosclerosis and kidney and eyesight failure. A patient with IDDM requires daily injections of insulin to survive.

25 The most common form of diabetes is non-insulin dependent diabetes (NIDDM) or Type II diabetes. Type II diabetes is a heterogenous group of
